

UPR Invoicing & Financials

Employee Guide

How we build invoices, review and save them to QuickBooks, record payments, and track collections inside the UPR app.

1. The Big Picture

JOB → BUILD INVOICE → SAVE → GET PAID → COLLECTIONS
(the work) (line items in UPR) (real QBO invoice) (payments recorded/reconciled) (track A/R)

- **One invoice per job — and a job is one division.** A claim with Mitigation and Reconstruction is two jobs = two invoices. Insurance pays each category on a separate check, so each check matches its own invoice.
- **Invoices are built line by line.** On the invoice editor each line carries a QuickBooks **Item + Class**, a description, and quantity × rate. The invoice total adds itself up — there's no single lump-sum box.
- **“Invoiced” means it’s in QuickBooks.** A new invoice starts as a **draft** in UPR. You add the lines, then click **Save** — now it's real, the balance clock starts, and it appears in Collections.
- **Invoice authoring is human-directed from UPR to QuickBooks.** Build and save invoices in UPR; QuickBooks is the accounting record. Externally managed QuickBooks, receipt, and Stripe payments are corrected in their owning system and then reconcile back to UPR.
- **A local manual payment stays local.** You may record, edit, or delete that UPR row without deleting or reposting a provider payment. Provider-owned and receipt-backed rows are view-only.
- **The financial numbers come straight from your invoices** — once a job has a saved invoice, its Invoiced / Balance update on their own.

2. Who Can Do What

- **Build invoices and estimates, use permitted QuickBooks actions, and record payments:** Admins, office staff, and project managers. **Payment Settings and payouts:** admins only. Estimate QuickBooks actions appear only when the strict document capability and provider-traffic gates allow them.
- **Everyone else:** can see the info (read-only). Edit buttons simply won't show.
- Billing is also behind the **Billing** feature switch — if it's off, the billing areas are hidden for everyone.

3. Start an Invoice

Two ways to begin — both open the same invoice editor. **One invoice per job:** if the job already has one, you land right back on it (never a duplicate).

- **“+ New invoice” button** — on a **Customer's page** (top) or on the **Collections** screen. Pick the job to bill and it opens the editor.

- **From the claim or customer** — open the claim's **Invoices & Payments** panel (or a customer's **Financial** tab) and click **Create invoice** on the job's row.

4. Build & Save to QuickBooks

Where: the invoice editor (the page that opens after you start an invoice).

- 1 Click **+ Add line**. Choose the QuickBooks **Item** and **Class**, type a **description**, then **quantity** and **rate**. The line amount and invoice **Total** fill in automatically.
- 2 Add as many lines as the job needs. **Line edits save by themselves** — no save button.
- 3 When the total is right, click **Save**. Status leaves **Draft** and a green **QuickBooks #** appears — now it's officially invoiced and shows in Collections.
- 4 Need to change it after saving? Edit the lines and click **Save** again to update QuickBooks.
- 5 The **Item** and **Class** lists come live from QuickBooks, so QuickBooks must be connected.

Fixing mistakes: A red **Error** banner usually means the customer needs a QuickBooks link — fix it and click **Save** again. To pull an invoice back into a draft, use **Manage menu: Revert to draft**. An invoice that was never saved can be removed with **Manage menu: Delete draft**.

Estimates: Build and edit estimate lines in UPR. When the strict document capability and provider-traffic gates are enabled, use **Save to QuickBooks** (or **Update QuickBooks**), **Send to customer** (or **Resend**), and **Manage menu: Revert to draft** for the QuickBooks estimate. **Convert to invoice** stays local: review the converted invoice, then use the human **Save** action on the invoice page when it is ready for QuickBooks.

5. Get Paid

Where: the claim's **Invoices & Payments** panel, a customer's **Financial** tab, or **Collections** → open the claim.

- 1 **A payment comes in?** Click **+ Record payment**, enter the amount and date, choose who paid (insurance / homeowner / other) and the method, add a reference, and save.
- 2 A local manual payment updates UPR's **Collected** and **Balance** figures; it is not a provider delete/repost path. Use the separate human-confirmed receipt workflow when a QuickBooks payment must be allocated across invoices.
- 3 **Collected** and **Balance** update right away; **Invoiced** doesn't change (it only reflects the invoice itself).

Card payments (Stripe pay-link): Card pay-links and Stripe payment projection remain temporarily unavailable under the current containment. Do **not** create, copy, or share a stored or legacy Stripe URL. Use the approved manual payment process instead.

6. Collections & the Numbers

Collections in the menu has two tabs: **A/R · Outstanding** (totals, aging buckets, overdue worklist) and **Payments** (cash-in history). Click any row to open that claim's A/R workspace. The same detail lives on each claim's **Invoices & Payments** panel and each customer's **Financial** tab.

Term	What it means
Invoiced	Total of the invoice's line items, once it's saved to QuickBooks. What we've officially billed.
Collected	Payments recorded or reconciled as received. Provider-owned and receipt-backed rows are view-only.
Balance	Invoiced - Collected. What's still owed.
Aging	How overdue the balance is vs. the due date — Current, 1-30, 31-60, 61-90, 90+ days.
Deductible Owed	The customer's deductible not yet collected.
Insurance A/R	What insurance still owes after the deductible.

Rule of thumb: **Invoiced - Collected = Balance**. If the Balance looks wrong, it's almost always an invoice that wasn't saved, or a payment that wasn't recorded.

7. Good Practices

DO

- One invoice per division (Mitigation and Reconstruction each get their own).
- Build the lines with the right **Item + Class** so the numbers land in the correct QuickBooks buckets.
- Only **Save** when the total is final — saving creates the real bill and starts the A/R clock. Not ready? Leave it a draft.
- Record payments the day they arrive, with the correct payer and method.
- Use the approved manual process while card pay-links and Stripe payment projection are unavailable.
- Mark the deductible received as soon as it's collected.

DON'T

- Don't try to make a second invoice for the same job — open the existing one and edit its lines.
- Don't save a guess. A saved invoice is a real bill in QuickBooks.
- Don't correct an externally managed payment in UPR. Correct QBO, receipt, or Stripe payments in their owning system, then let the reconciliation path update UPR.
- Don't use **Revert to draft** unless you mean to pull the invoice back to correct and re-save.

8. FAQ / Troubleshooting

Q: How do I take a card payment from a customer?

Card pay-links and Stripe payment projection remain temporarily unavailable under the current containment. Do **not** share a stored or legacy Stripe URL; use the approved manual payment process instead.

Q: I recorded a payment — did it reach QuickBooks?

Local manual payment records stay in UPR. The separate receipt workflow is a human-confirmed QuickBooks payment action; QBO-, receipt-, and Stripe-managed payments reconcile back from their owning systems.

Q: Can I edit or delete a payment?

You can update or delete a local manual payment; that changes only the UPR record and never deletes or reposts a provider payment. QBO-linked, QBO-imported, Stripe-projected, receipt-backed, and other externally managed payments remain view-only; correct those through their owning system or approved receipt process.

Q: What changed for estimates?

Estimates are built and edited in UPR. When the strict document capability and provider-traffic gates are enabled, Save to QuickBooks / Update QuickBooks, Send to customer / Resend, and Revert to draft are available for the QuickBooks estimate. Convert to invoice remains local: review the converted invoice, then use the human Save action on the invoice page when it is ready for QuickBooks.

Q: The Collections balance still shows an old number.

That job probably predates this system. Older jobs keep their existing numbers and don't need re-invoicing. Only jobs with a freshly saved invoice switch to the new figures.

Q: I got a red "Error" badge.

Hover it to see why — usually the customer needs to be linked to a QuickBooks customer first. Fix that, then Save again.

Q: Can I undo a Save?

Yes — on the invoice editor, use Manage menu: Revert to draft. Just fixing line items? Edit the lines and click Save again.

Q: Why don't I see the Item / Class dropdowns?

They load live from QuickBooks, so QuickBooks must be connected (Dev Tools → Integrations).

Quick Cheat-Sheet

To bill a job: + *New invoice* (or Claim → Invoices & Payments → *Create invoice*) → add line items (Item + Class, qty × rate) → Save (green QuickBooks # = done).

To collect: Collections → open claim → + *Record payment* (local manual record), or use the separate human-confirmed receipt workflow for a QBO allocation. Card pay-links are temporarily unavailable; do not share legacy Stripe URLs.
